

## MERGING

Step 1: Start

Step 2: Declare the variables

Step 3: Read the size of the first array

Step 4: Read elements of first array in sorted order

Step 5: Read the size of second array

Step 6: Read the elements of second array in sorted order

Step 7: Repeat Step 8 and 9 until  $k = n$  &  $j < 0$

Step 8: check if  $a[i] \geq b[j]$  then  $c[k+i] = b[j+i]$

Step 9: else  $c[k+i] = a[i+i]$

Step 10: Repeat step 11 until  $k = n$

Step 11:  $c[k+i] = a[i+i]$

Step 12: Repeat step 13 until  $j = n$

Step 13:  $c[k+i] = b[j+i]$

Step 14: Print the first array

Step 15: Print the second array

Step 16: Print the merged array

Step 17: end.

## Stack Operations

Step 1 : Start

Step 2 : declare the node and the required variables

Step 3 : declare the functions for push, pop, display  
and search an element

Step 4 : Read the choice from the user.

Step 5 : If the user choose to push an element then  
read the elements to the pushed & call the  
function to push the element by passing the  
value to function

Step 5.1 :  
declare the newnode & allocate memory for  
the newnode.

Step 5.2 : Set newnode → data = value

Step 5.3 : Check if top == null then set newnode →  
next = null

Step 5.4 : Set newnode → data = value

Step 5.5 : Set top = newnode & then print insertion  
is successful

Step 6 : If user choose to pop an element from  
the stack then call the function to pop

the elements.

STEP 6.1 : check if  $\text{pop} == \text{NULL}$  then point  
Stack is empty

STEP 6.2 : Else declare a pointed variable temp  
and initialize it to top.

STEP 6.3 : Point the element that being deleted

STEP 6.4 : set  $\text{temp} = \text{temp} \rightarrow \text{next}$

STEP 6.5 : free temp

STEP 7 : If the user choose the display then call the  
function to display the element in the stack.

STEP 7.1 : check if  $\text{top} == \text{NULL}$  then point stack is  
empty

STEP 7.2 : else declare a pointed variable temp &  
initialize it to top

STEP 7.3 : Repeat steps below till  $\text{temp} \rightarrow \text{next}$   
 $\text{NULL}$

STEP 7.4 : Point  $\text{temp} \rightarrow \text{next}$

STEP 8 : If the user choose to search an element  
from the stack then call the function to  
Search an element,

Step 8.1 : declare all pointers variable p12 and others

### Necessary variable

Step 8.2 : initialise p12 = top

Step 8.3 : check if p12 = null then print stack empty

Step 8.4 : else read the element to be searched

Step 8.5 : Repeat step 8.6 to 8.8 while p12 != null

Step 8.6 : check if p12 → data == item then print  
element founded and to be located and  
Set flag = 1

Step 8.7 : else set flag = 0

Step 8.8 : Increment i by 1 and set p12 = p12 → p12

Step 8.9 : check if flag = 0 then print the element  
not found

Step 9 : end.

## Circular Queue operation

Step 1: start

Step 2: declare the queue and other variables.

Step 3: declare the functions for enqueue, dequeue, search and display

Step 4: Read the choice from the user

Step 5: If the user choose the choice enqueue. then Read the element to be inserted from the user and call the enqueue function by passing the value.

Step 5.1: check if front == -1 and rear == -1 then set

front = 0, rear = 0 and set queue[rear] = element.

Step 5.2: else if rear + 1 > max == front or front = rear + 1 then print queue is overflow

Step 5.3: else set rear = rear + 1, max and set queue[rear] = element.

Step 6: If the user choice is the option dequeue then call the function dequeue.

Step 6.1: check if front == -1 and rear == -1 then queue is underflow.

STEP 6.2: else check if front == rear then point  
the element is to be deleted then set  
 $front = -1$  and  $rear = -1$

STEP 6.3: else point the element to be deleted set  
 $front = front + 1 \vee max$ .

STEP 7: If the user choice is to display the queue then  
call the function display.

STEP 7.1: check if front == -1 and rear == -1 then point  
queue is empty.

STEP 7.2: else repeat the step 7.3 while  $i < rear$

STEP 7.3: print queue[i] and set  $i = i + 1 \vee max$

STEP 8: If the user choose the search. then call the  
function to search an element in the queue.

STEP 8.1: Read the element to be searched in the  
queue.

STEP 8.2: check if item == queue[i] then point  
item found and its position and increment  
 $i$  by 1.

Step 8.8: check if  $c == 0$  then period item not found

Step 9: end.

## linked list operation

Step 1: Start

Step 2: declare a structure and related variables.

Step 3: declare function to create a node, insert a node  
in the beginning, at the end and given  
position, display the list and search an element  
in the list.

Step 4: define function to create a node, declare the  
required variables

Step 4.1: Set memory allocated to the node = temp then  
Set temp  $\rightarrow$  prev = null and temp  $\rightarrow$  next = null

Step 4.2: Read the value to be inserted to the node.

Step 4.3: Set temp  $\rightarrow$  p = data and increment by 1

Step 5: Read the above from the user to perform  
different operation on the list.

Step 6: If the user choose to perform insertion operation  
at the beginning then call the function. to  
perform insertion.

Step 6.1 : check if head == null then call the function to create a new node. perform step 4 to 4.3

Step 6.2 : set head = temp and temp1 = head

Step 6.3 : else call the function to create a new node. perform step 4 and 4.3 then set temp  $\rightarrow$  next = head, head  $\rightarrow$  prev = temp and head = temp.

Step 7 : If the user choice is to perform insertion at the end of the list, then call the function to perform the insertion at the end.

Step 7.1 ~~= if head ==~~

check if head == null then call the function to create a new node then set temp = head and then set head = temp1

Step 7.2 : else ~~call~~ call the function to create a new node then set temp1  $\rightarrow$  next = temp, temp  $\rightarrow$  prev = temp1 and temp1 = temp.

Step 8 : if the user choose to perform insertion in the list at any position then call the function to perform the insertion operation

Step 8.1 : declare the necessary variable

Step 8.2 : Read the position where the node need to be inserted , set temp = head .

Step 8.3 : check if pos < 0 or pos >= count + 1 then point the position is out of range .

Step 8.4 : check if head == null and pos = 1 then call part "empty list cannot insert other than last position .

Step 8.5 : check if head == null and pos != 1 then call the function to create newnode , then set temp = head and head = temp .

Step 8.6 : call  $\rightarrow$  pos then set temp2 = temp  $\rightarrow$  pos  
the increment by 1 .

Step 8.7 : call the function to create a new node  
and then set temp  $\rightarrow$  posv = temp2 ,  
temp  $\rightarrow$  next = temp2  $\rightarrow$  next  $\rightarrow$  posv .  
temp2  $\rightarrow$  next = temp .

Step 9.1: If user choose to perform deletion operation  
is the list then all the function to perform the deletion operation

Step 9.1: declares the necessary variables.

Step 9.2: Read the position whose node need to be deleted set temp = head

Step 9.3: check if pos < 1 or pos > = (count + 1) then point position out of range.

Step 9.4: check if head == null then point the list is empty.

Step 9.5: while i < pos then temp2 = temp  $\rightarrow$  next  
and increment i by 1.

Step 9.6: check if i == then check head == null  
 $\rightarrow$  temp2 == null then point node deleted free (temp2)

Set temp2 = head = null

Step 9.7: check if temp2  $\rightarrow$  next == null then temp2  
 $\rightarrow$  next == null then free (temp2) then  
point node deleted.

Step 9.8: temp2  $\rightarrow$  next  $\rightarrow$  prev = temp2  $\rightarrow$  prev then  
check if i == 1 then temp2  $\rightarrow$  prev  $\rightarrow$  next  
 $=$  temp2  $\rightarrow$  next .

- Step 9.9 : check if  $i=1$  then head = temp2 → next then  
point node deleted then save temp2 and decrement  
count by 1
- Step 10: If the user choose to perform the display operation  
then call the function to display the list.
- Step 10.1 : set temp2 = n
- Step 10.2: check if temp2 = null then point list is empty
- Step 10.3: compare temp2 → next != null then print  
temp2 → n then temp2 = temp2 → next .
- Step 11: If the user choose to perform the search  
operation then call the function to perform search  
operation .
- Step 11.1 : declare the variables
- Step 11.2: set temp = head
- Step 11.3: check if temp2 == null the point list is  
empty
- Step 11.4: Read the value to be searched .
- Step 11.5: compare temp2 != null then check if  
temp2 → n == data then point element  
found at position count +1

Step 11.6 : else set tempQ = tempQ → next and  
increments count by 1

Step 11.7: point elements not found in the list

Step 12: end

## Set operations

Step 1: start

Step 2: declare the variables

Step 3: Read the choice from the user to perform a set operation.

Step 4: If user choose to perform union

Step 4.1: Read the cardinality of the two sets

Step 4.2: check if  $m \neq n$  then print cannot perform union.

Step 4.3: else read the elements in both the sets

Step 4.4 • Repeat the steps 4.5 to 4.7 until 1 cm

Step 4.5: to check  $C[i] = [A[i]] \cup [B[i]]$

Step 4.6 print  $C[i]$

Step 4.7: increment i by 1

Step 5: Read the choice from the user to perform intersection.

Step 5.1: Read the cardinality of sets.

Step 5.2 : If  $m_1 = n$  then print cannot perform intersection.

Step 5.3 : else read the element is both the sets

Step 5.4 : Repeat the step 5.5 to 5.7 until 100

Step 5.5 :  $C[i] = A[i] \& B[i]$

Step 5.6 : print  $C[i]$

Step 5.7 : increment i by 1

Step 6 : If the user choose to perform set difference operation.

Step 6.1 read the cardinality of 2 sets

Step 6.2 : check if  $m_1 > n$  then print cannot perform

Set ~~operation~~ difference operation.

Step 6.3 : else read the element in both sets

Step 6.4 : Repeat the step 6.5 to 6.8 until 100.

Step 6.5 : check if  $A[i] == 0$  then  $C[i] = 0$

Step 6.6 : else if  $B[i] == 1$  then  $C[i] = 0$

Step 6.7 : else  $C[i] = 1$

Step 6.8 : increment i by 1

Step F: Repeat the step F-1 and F-2 until 1cm

Step F-1: point C(i)

Step F-2: increment i by 1

Step: end

## Search tree

Step 1: Start

Step 2: declare a structure and structure pointer  
for insertion deletion and search operations  
and also declare a function for inorder traversal.

Step 3: Declare a pointer as root and also the required  
variable.

Step 4: Read the choice from the user to perform insertion,  
deletion, searching and inorder traversal

Step 5: If the user choice to performs insertion operation  
then read the value which is to be inserted to the  
tree from the user.

Step 5.1: Take value to be inserted at the pointed and  
~~the root pointer~~

Step 5.2: check if !root then allocate memory for  
the root.

Step 5.3: Set the value to the info part of the  
root and then set left and right part of  
the root to null and return root.

STEP 5.4: check if  $\text{root} \rightarrow \text{info} > x$  then call  
the insert pointer to insert  $x$  at the  
 $\text{root}$

STEP 5.5: check if  $\text{root} \rightarrow \text{info} < x$  the call insert  
pointer to insert  $x$  at the <sup>right</sup> of the  
 $\text{root}$ .

STEP 5.6: return  $\text{root}$

Step 6: If the user choose to perform deletion operation  
then read the elements to be deleted from the  
tree  $\text{pt}$  and the  $\text{root}$  point and the item to  
be delete pointed.

Step 6.1: check if  $\text{pt} = \text{null}$  then point node not found

Step 6.2: else if  $\text{pt} \rightarrow \text{info} = x$  then call delete pointer  
by passing the  $\text{pt}$  pointers and the item.

Step 6.3: else if  $\text{pt} \rightarrow \text{info} > x$  then call delete pointer  
by using the left pointers and the  $\text{Hed}$ .

Step 6.4: check if  $\text{pt} \rightarrow \text{info} = -\text{Hem}$  then check if  
 $\text{pt} \rightarrow \text{left} = \text{pt} \rightarrow \text{right}$  then free  $\text{pt}$  and  
return null.

Step 6.5: else if  $\text{pt} \rightarrow \text{left} = \text{null}$  then set  $\text{pt} = \text{pt} \rightarrow \text{right}$   
and free  $\text{pt}$ , return  $\text{pt}$

Step 6.7: else set  $p_1 = p_2 \rightarrow \text{right}$  and  $p_2 = p_2 \rightarrow \text{left}$

Step 6.8: while  $p_1 \rightarrow \text{left}$  not equal to null, sets  $p_1 \rightarrow \text{left}$   $p_2 \rightarrow \text{left}$  and goes to the pto second  $p_2$ .

Step 6.9: return  $p_1$

Step 7: if the user chooses to perform search operation to call the pointer to perform a search operations.

Step 7.1 declare the pointers and variables.

Step 7.2: Read the elements to be searched.

Step 7.3: while  $p_2$  check if  $\text{item} > p_2 \rightarrow \text{info}$  then  $p_2 = p_2 \rightarrow \text{right}$ .

Step 7.4: else if  $\text{item} < p_2 \rightarrow \text{info}$  then  $p_2 = p_2 \rightarrow \text{left}$

Step 7.5: else break.

Step 7.6: check if  $p_2$  then point that the element is found.

Step 7.7: else ~~point~~ element not found in the tree and return 000.

Step 8.1 If root not equals to null recursively call  
the functions by passing root → left.

Step 8.2 : print root → info

Step 8.3 : call the traversal function recursively  
by passing root → right.

Step 9: end

disjoint, set

Step 1: Start

Step 2: declare structure and set structure variable

Step 3: declare a function `makeSet()`

Step 4: Repeat Step 3.0 to 3.4 until kn

Step 5: Set : `cls.sets[i]` is set to i

Step 6: set `dis.rank[i]` is equal to 0

Step 7: increment i by 1.

Step 8: declare a function `display set`.

Step 4.1: Repeat step 4.2 and 4.3 until kn

Step 4.2: Print `dis.parent[i]`

Step 4.3: Increment i by 1

Step 4.4: Repeat step 4.5 and 4.6 until kn

Step 4.5: Print `dis.rank[i]`

Step 4.6: increment i by 1.

B: declare a function `find` and pass to the function

Step 5.1: check if `dis.parent[x] != {}` then set to

return value to `dis.parent[x]`

Step 5.2: return `dis.parent[x]`

Step 6.3: declare a function and kn variable

- STEP 6.1 : set  $x.set$  to find( $x$ )  
 STEP 6.2 : set  $y.set$  to find( $y$ )  
 STEP 6.3 : check if  $x.set = y.set$  then reward.  
 STEP 6.4 : check if  $\text{dis.rank}[x.set] < \text{dis.rank}[y.set]$   
 STEP 6.5 : set  $y.set = \text{dis.parent}[y.set]$   
 STEP 6.6 : set -1 to  $\text{dis.rank}[x.set]$   
 STEP 6.7 : else if check  $\text{dis.rank}[x.set] > \text{dis.rank}[y.set]$   
 STEP 6.8 : set  $x.set$  to  $\text{dis.parent}[y.set]$   
 STEP 6.9 : set -1 to  $\text{dis.rank}[y.set]$   
 STEP 6.10 : and the  $\text{dis.parent}[y.set] = x.set$ ,  
 STEP 6.11 : set  $\text{dis.rank}[x.set] + 1$  to  $\text{dis.rank}[x.set]$   
 STEP 6.12 : set -1 to  $\text{dis.rank}[y.set]$   
 STEP 7 : Read no. of elements.  
 STEP 8 : Call the function `makeSet`  
 STEP 9 : Read the choice from to perform union and  
         and find display operation  
 STEP 10 : If the user chooses to perform union operation  
         read the element to perform union operation. Then  
 STEP 11 : call the function to perform union operation.

Step 11 : If the user choose to perform find operation  
check the element to check is connected.

Step 11.1 : Check if  $\text{find}(x) == \text{find}(y)$  then print  
connected components

Step 11.2 : Else print the not connected component

Step 12 : If the user choose to perform display  
operation call the function display set

Step 13 : end .
